APPLICATION - RESEARCH ENGINEER

Dear Ottobock Research Team,

What particularly interests me about this position is the opportunity to apply robotics and control engineering to prosthetic and orthotic systems that interact directly with the human body. I find the complete control chain particularly fascinating: from sensing and estimating user intent to control and safety constraints, and ultimately the actuation that produces reliable and natural motion.

Control engineering has been a recurring focus throughout my work. During my Bachelor's thesis at the Automation and Control Institute (ACIN), I developed a cascaded position and velocity controller for the PMSM-driven actuators of a high-speed pan-tilt system, combined with Kalman-filtered motion estimation. I later expanded this background through nonlinear Model Predictive Control, implementing constraint-aware real-time optimization for robotic systems.

Most recently, I worked as a Robotics Software Engineer at Baubot, where I independently developed and integrated robotics software from prototype to deployment on the physical system, including autonomous navigation, ROS 2 system architecture, simulation, testing, and deployment on industrial hardware. I also worked as a Research Assistant at UAS Technikum Wien, focusing on ROS 2, nonlinear optimization with PyTorch, and deep reinforcement learning.

What particularly attracts me to Ottobock is the challenge of translating sensor information and user intent into appropriate actuator behavior under physical and safety constraints. I am especially interested in exploring how model-based control can be complemented by learning-based methods and transferred from research to working prototypes.

I would be excited to contribute my background in robotics, control engineering, and software development to Ottobock's Research Hub in Vienna. Further details on my work and projects can be found in my [portfolio](#).

Sincerely,

Kevin Eppacher
