APPLICATION - ROBOTICS SOFTWARE ENGINEER

Dear Aeolus Robotics Team,

What particularly interests me about this position is the opportunity to take ownership of autonomous navigation and turn state-of-the-art robotics methods into robust, production-ready systems. I enjoy working across the navigation stack, from algorithms and robot behavior to integration and testing on physical robots.

At fischer Baubot GmbH, I worked on autonomous navigation on the physical robot using a Regulated Pure Pursuit (RPP) controller and compensated odometry drift using total station measurements. In the second development phase, I took technical responsibility for building the ROS 2 stack from the ground up, including custom C++ APIs for Nav2 and MoveIt 2 and automated unit and end-to-end integration tests using headless Gazebo simulations in CI/CD, followed by deployment and validation on the target industrial IPC.

My academic work includes nonlinear Model Predictive Control (nMPC) for mobile robots and my Master's thesis, SAGE, evaluated on object-search tasks in Matterport3D environments. SAGE combines autonomous exploration and Nav2 with behavior-tree-based decision making, persistent 3D semantic mapping, and Vision-Language Models (VLMs) to enable a robot to explore unknown environments and search for semantically specified objects.

At Aeolus, I would like to combine these two sides of my experience by exploring advanced methods for robot autonomy and engineering them into modular, extensible, and extensively tested software for reliable real-world operation.

I look forward to discussing how my experience can contribute to Aeolus Robotics. Further details on my work and projects can be found in my [portfolio](#), and I have attached my employment reference from Baubot.

Sincerely,

Kevin Eppacher
