APPLICATION - JUNIOR ROBOTICS ENGINEER

Dear Aeolus Robotics Team,

Dr. Michael Zillich recommended this position to me, and its broad technical scope immediately caught my attention. What particularly interests me is the opportunity to work across the robotics stack and contribute to reliable autonomous systems operating in real-world environments. I enjoy working closely with physical robots, investigating system behavior, solving integration problems, and turning promising robotics approaches into robust, maintainable, and thoroughly tested software.

At fischer Baubot GmbH, I worked on autonomous navigation and localization on a physical mobile robot. I took technical responsibility for building the ROS 2 stack from the ground up, including custom C++ APIs for Nav2 and MoveIt 2, automated unit and end-to-end integration tests using headless Gazebo simulations, CI/CD, and deployment and validation on industrial hardware.

Prior to that, at Blue Danube Robotics (AIRSKIN), I gained hands-on experience with industrial robots, motion planning, sensor integration, and C++ development. My academic work complements this practical experience with autonomous navigation, nonlinear optimization, computer vision, and semantic perception. In my Master's thesis, SAGE, I combined autonomous exploration, behavior-tree-based decision making, 3D semantic mapping, and Vision-Language Models for autonomous object search.

The broad technical scope of this position, ranging from debugging and system integration to perception, manipulation, and autonomy, particularly matches my interests. What drives me most is understanding complex robotic systems as a whole, solving problems across component boundaries, and developing software that remains reliable when deployed on physical robots.

I look forward to discussing how my experience in robotics software and real-world system integration can contribute to Aeolus Robotics. Further details on my work and projects can be found in my [portfolio](#), and I have attached my employment reference from Baubot.

Sincerely,

Kevin Eppacher
