Employment reference

Mr. Kevin Eppacher, born on 4 August 2000, was employed by our company as a Robotics Engineer from 5 March 2026 to 5 September 2026.

His agreed standard working hours were 38.5 hours per week.

Mr. Eppacher works in a highly independent and proactive manner, consistently identifying and taking on relevant work without needing direction. He is hands-on, learns new technologies very quickly, and is always ready to support colleagues whenever needed. He is easy to work with, highly intelligent, and sociable, which made him a valued and well-liked member of the team.

His key areas of responsibility included:

- Sole technical responsibility for the design, architecture, and development of the ROS 2 software stack from scratch in the second development phase (Linux), including the robot description built from CAD models and the integration and configuration of ros2_control,
- Design and implementation of application-specific C++ Action APIs for Nav2 and MoveIt 2, abstracting navigation and motion planning capabilities according to system-specific requirements,
- Development of a Gazebo-based simulation environment for development, integration, and automated testing, including an automated headless integration environment that jointly validated the robot description, controllers, MoveIt 2, and Nav2 through the developed ROS 2 Action APIs,
- Responsibility for autonomous navigation in the Python-based first development phase, including development and optimization of a Regulated Pure Pursuit (RPP) controller, processing of localization and odometry data with drift compensation via a total station, and testing on the physical robot,
- Development of automated unit and integration tests,
- Design and implementation of CI/CD workflows using GitHub Actions with a local runner, including linting, static type checking, and containerization with Docker/Podman to ensure code quality, maintainability, and reproducible environments,
- Evaluation and validation of suitable industrial PC (IPC) hardware, including deployment and testing of the ROS 2 stack on the target platform and evaluation of the interface to the existing PLC-based hardware system,
- Code reviews for other team members.

Mr. Eppacher's work reflects both strong software engineering fundamentals and a deep, hands-on understanding of robotics systems.

The quality of his work was consistently excellent, and he completed his responsibilities to our full satisfaction.

His conduct towards supervisors, colleagues, and external partners was exemplary and professional at all times. He was a highly valued, reliable, and supportive team member who readily shared his knowledge and actively promoted constructive collaboration across departments. Within our international team, cooperation with Mr. Eppacher was consistently smooth and effective.

Mr. Eppacher's employment ends on 5 September 2026 as a result of a company restructuring. This decision was based solely on economic and organizational considerations and was in no way related to his performance or conduct. We sincerely regret his departure and would have been very pleased to continue working with him.

We would like to thank Mr. Eppacher for his outstanding commitment, excellent professional contributions, and consistently reliable work. We wish him every success and all the very best in his future professional and personal endeavors.

Sincerely,

Alexis Müller, Team Lead System Software

Alexander Barth, CEO
