APPLICATION - ROBOTICS SOFTWARE ENGINEERING

Dear KNAPP Robotics Team,

I have been following KNAPP's robotics opportunities for some time, and what particularly interests me is the combination of modern robotics software development with an industrial environment. I particularly enjoy bringing technologies such as ROS into industrial applications and developing them into robust, maintainable systems for real-world deployment. This position therefore immediately caught my attention, as it closely aligns with both my previous experience and the direction in which I want to continue developing.

At Baubot, I had the opportunity to take technical responsibility for building a ROS 2 software stack from scratch, including navigation, motion planning, simulation, automated testing, and deployment on industrial hardware. During the first development phase, I was responsible for autonomous navigation on the physical robot, including a Regulated Pure Pursuit (RPP) controller and localization correction using external total station measurements. Prior to that, at AIRSKIN, I gained hands-on experience developing software for industrial robotic systems and further expanded my mobile robotics background through KUKA AMR training.

The broad technical scope of the position, ranging from localization and navigation to control and AI, particularly matches my interests. My academic work has allowed me to explore advanced concepts in nonlinear control, optimization, state estimation, and autonomous exploration using Vision-Language Models (VLMs). What drives me most is exploring state-of-the-art approaches to solve challenging robotics problems and turning promising concepts into maintainable, thoroughly tested software for industrial systems.

I look forward to the opportunity to discuss how my experience can contribute to KNAPP's mobile robotics development. Further details on my work and projects can be found in my [portfolio](#), and I have attached my employment reference from Baubot.

Kind regards,

Kevin Eppacher
