APPLICATION - ROBOTICS SOFTWARE ENGINEERING

Dear Natascha Schalkhas,

Several people in my network have encouraged me to reach out to Taurob, including Jens Steinhauser and Vincent McKenna, whom I worked closely with at Baubot, as well as my former university colleague Alexander Hamböck. My interest in Taurob, however, goes back to when Lukas Silberbauer presented the company at UAS Technikum Vienna. Since then, I have been particularly interested in Taurob's R&D work and the challenges of enabling robots to navigate autonomously through confined industrial environments and interact with their surroundings.

At Baubot, I had the opportunity to take technical responsibility for building a ROS 2 software stack from scratch, including navigation, motion planning, simulation, automated testing, and deployment on industrial hardware. Prior to that, at AIRSKIN, I gained hands-on experience developing software for industrial robots, while my academic work has focused on autonomous navigation, nonlinear control and optimization, localization, and autonomous exploration using Vision-Language Models (VLMs).

I recently had the opportunity to speak with Martijn de Kwaasteniet at the Vienna Robotics Festival, where I learned about Taurob's ongoing work on its ROS 2 software architecture. Given my recent experience building a ROS 2 stack from the ground up, I am interested in contributing to this development while further expanding my experience with autonomous mobile manipulators in demanding real-world environments.

I look forward to the opportunity to discuss how my experience can contribute to Taurob's robotics software development. Further details on my work and projects can be found in my [portfolio](#), and I have attached my employment reference from Baubot. Jens Steinhauser is also available as a professional reference upon request.

Kind regards,

Kevin Eppacher
