APPLICATION - ROBOTICS INTEGRATION ENGINEER

Dear DCCS Team,

What particularly interests me about this position is the opportunity to combine robotics software, system integration, and learning-based methods for mobile manipulators. I am especially interested in integrating capabilities such as foundation models and learning from demonstration into structured robotic systems for reliable industrial applications.

At Baubot, I took technical responsibility for building a ROS 2 software stack from scratch, including autonomous navigation, motion planning, simulation, and automated testing. I developed multithreaded C++ Action interfaces for Nav2 and MoveIt 2 and integrated unit and end-to-end tests using headless Gazebo simulations into CI/CD. Prior to that, at AIRSKIN, I gained hands-on experience with industrial robots, including motion planning, sensor integration, and calibration with KUKA and UR systems.

My academic work complements this experience with optimization and AI for robotics. At UAS Technikum Vienna, I worked on real-time Model Predictive Control (MPC) and Deep Reinforcement Learning (DRL). My Master's thesis further explored RGB-D perception, 3D semantic mapping, Vision-Language Models (VLM), and behavior-tree-based autonomous navigation for semantic object search in NVIDIA Isaac Sim.

I am particularly interested in applying these technologies to mobile manipulation and humanoid robotics. To explore robot learning on physical hardware, I am currently building an SO-101 setup with ROS 2 control integration for learning-based manipulation. Working with technologies such as NVIDIA Isaac and GR00T, demonstration learning, and synthetic data at DCCS therefore closely matches the direction in which I want to further develop.

I look forward to discussing how my background in ROS 2, industrial robotics, autonomous systems, and robot learning can contribute to DCCS's humanoid robotics activities. Further details on my work and projects can be found in my [portfolio](#).

Kind regards,

Kevin Eppacher
